

DeftCom Showcases TDMS™ at CTIA Show in Atlanta

Complete Testing Management and Database Software Solution

(Kirkland, Wash.) February 16, 1998 – DeftCom Inc., the premier provider of test solutions for the communications industry will showcase its premier product, TDMS™ (Test Data Management System) at the Cellular Technical Industry Association (CTIA) Tradeshow in Atlanta February 23 - 25.

Developed to define tracking requirements, develop test cases, track troubles, and generate reports, TDMS employs the integration of tests, troubles and requirements and uses a familiar "explorer-like" interface.

During the project definition and management phase of the test cycle, test managers have the ability to differentiate between the products or services under test. Test case planning allows the tester to match test cases to a particular phase of the test lifecycle. After defining the project and the phase under test, test managers determine which tests to execute in a phase.

Data collection reports give the tester a high-level snapshot of test results to gauge progress throughout the test lifecycle. After all the tests have been executed, this report becomes part of the final analysis of the product or service under test.

DeftCom provides its customers with network integration, test and validation; conformance/performance test; network assessment and certification; remote test and monitoring; lab design and test equipment consultation; and contractor search and placement.

DeftCom tests and certifies voice, data and signaling networks for wireless service providers, landline service providers and manufacturers of communications network equipment. The unique methodology developed by DeftCom includes TDMS.

DeftCom, based in Kirkland, Washington, is an international firm providing test solutions for the communications industry.
